

Wheel

Raspberry Pi OS does not have the wheel group by default. It can be added with

```
sudo groupadd wheel
```

A user can then be added to the wheel group with

```
sudo usermod -aG wheel username
```

The `-a` flag appends the group, such that the user is not removed from all groups that are not explicitly listed in this command. The `-G` flag specifies the groups that the user will be added to, listed directly after the flag.

Whether the user is now added to the group can be checked with

```
cat /etc/group
```

There should be an entry similar to

```
wheel:x:1001:username
```

This entry confirms that the user has been added to the wheel group.
